Architecture

LocalSpace is a **modular monolith**: a React single-page app talking to an Express API that stores everything in SQLite.

Components

Layer	Technology	Responsibility
Web	React, TipTap, Zustand	UI and rich-text editing
API	Express, TypeScript	Validation, transactions, search
Storage	SQLite + filesystem	Pages in the database, attachments on disk

Autosave flow

1. Editor change → debounce 800 ms
2. PUT /api/pages/:id with the last known version
3. Server checks the version, saves, returns the new version
4. On error the content stays in memory and the save is retried

```
await api.savePage(id, { version, title, contentJson });
// 409 means the page changed elsewhere — never overwrite silently
```

> Keep it simple, practical and extensible.
